Summary

Application developer at Rutgers University with experience spanning full-stack platforms, infrastructure automation, and security. Built and shipped features across Django, React, JupyterLab, and Ansible-managed deployments used in CS and data science courses. Background in competitive cyber defense and network security tooling.

Experience

Rutgers University, Application Developer

June 2025 - Present

- Maintained and extended codePost, a full-stack code grading platform (Django API, React UI, Celery workers) deployed across 4 VMs with Docker Compose, serving 500+ students per semester with autograding, a multi-language test framework with per-cell Jupyter evaluation, and AI-assisted comment generation (Ollama/OpenAI) with org-level cost tracking.
- Designed and built jupyter-assignments, a JupyterLab sidebar extension (React/TypeScript + Python) with a 4-tier role system (student/grader/staff/instructor) and a platform adapter pattern abstracting codePost and Autolab behind a unified interface, enabling in-editor assignment management across multiple grading platforms.
- Automated JupyterHub deployment across course servers with Ansible, managing CAS/Kerberos/Azure auth, Python versioning, modular extensions, and Zabbix monitoring.
- Published next-cas-client, an npm package providing CAS 2.0/3.0 and SAML 1.1 single sign-on for Next.js applications with iron-session session management.
- Built a 3-way notebook merge tool using content-similarity matching to prevent instructor updates from clobbering student edits in shared activebooks.
- Led WCAG accessibility remediation on codePost-ui and built an accessibility scanner (Flask, Playwright, Docker) for automated audits across university domains.
- Patched directory traversal, privilege escalation, and infinite recursion vulnerabilities; migrated codePost-ui from CRA to Vite + React Router v7.

Rutgers University, Student Lab Technician

January 2023 - May 2025

- Managed 10 Hackerspace workspaces, writing student-focused documentation and maintaining the WordPress site, modernizing the space.
- Developed a Raspberry Pi learning environment with MediaPipe, boosting student engagement by 70%.
- Developed a 3D printer monitoring service using Express and React to stream live video, increasing printer usage by 30%.

Swish, Full-Stack Developer

July 2021 - December 2021

- Automated account creation on web platforms using Puppeteer and Node.js, accelerating creation by 300% with Mocha-based testing.
- Migrated CLI to Electron desktop application, increasing user engagement by 200%.

C-Tech, Computer Technician

July 2019 - December 2021

- Automated computer initialization with Powershell scripts, cutting build time from 40 to 20 minutes.
- Implemented a secure HDD erasure workflow processing dozens of drives daily, onboarding 3 new enterprise clients.

Skills

Languages: Python, TypeScript, JavaScript, C, Java, Golang

Frameworks: React, Django, Flask, Next.js, Express, JupyterLab, Electron

Data: MariaDB, MongoDB, Redis, Celery, LevelDB

Infrastructure: Docker, Ansible, Nginx, Linux, Proxmox, VMware, AWS, GitHub Actions, Zabbix

Other: Git, Playwright, Tree-sitter, OpenCV, Ollama, Network Security

Projects

AppTracker

2025

- Built a TypeScript application that tracks job applications by reading incoming emails via IMAP, classifying them with a Bayesian classifier, and generating status updates using Ollama AI models.
- Integrated Discord bot notifications and MongoDB storage to provide real-time application status updates.

Jackal

November 2024

- Developed a Node.js-based frontend for Suricata network log analysis, enabling the review of 1M+ logs per day with interactive web-based graph visualizations.
- Built a queue system supporting ingestion of 1000+ events per second and a MongoDB pipeline with sub-100ms query latency for terabytes of logs.

CompLock

November 2023 - Present

- Developed SSH command and control software for networked computers in TypeScript, leveraging LevelDB and SSH2, utilized by RUSEC in CCDC competitions.
- Reduced password rotation on 30 machines from 5 minutes to 30 seconds with automated testing via GitHub Actions and Mocha.

mohamadk.com

2024 - Present

- Designed and built a Next.js 16 / React 19 portfolio with a markdown blog pipeline, PWA support, an in-browser WebContainers code playground running my published npm package, and a simulated Linux shell in TypeScript as the 404 page.

ts-declaration-json

October 2024

- Created an NPM package that parses TypeScript modules and returns declarations as JSON, enabling automated React component generation with parallel child processes.

Drone Project

January 2023 - May 2023

- Implemented OpenCV vision algorithms to guide a drone along computer-generated paths, achieving 90% search precision with 10x range increase via cellular communication.

Education

Bachelor of Arts, Computer Science

May 2025

- Rutgers University — Coursework: Computer Security, Software Methodology, Computer Architecture.

Leadership

Vice President, RUSecurity

January 2023 - May 2025

- Directed network administration for CCDC, with the team placing 4th in 2024.
- Led club infrastructure setup using Proxmox and VMware ESXi, yielding a 70% increase in technical competency.
